Dynamics of System

Each timestep the human moves randomly to an adjacent cell. And Robot also moves randomly to an adjacent cell.

Typical Questions:

- "What's the expected time until the human is crushed like a bug?"
- "What's the probability that the robot will hit the left wall before it hits the human?"
- "What's the probability Robot crushes human on next time step?"

Slide 11

Example Question "It's currently time t, and human remains uncrushed. What's the probability of crushing occurring at time t + 1?" If robot is blind: We'll do this first We can compute this in advance. If robot is omnipotent: Too Easy. We (I.E. If robot knows state at time t), won't do this can compute directly. If robot has some sensors, but Main Body incomplete state information ... of Lecture Hidden Markov Models are applicable! opyright © Andrew W. Moor

What is $P(q_t = s)$? slow, stupid answer

Step 1: Work out how to compute P(Q) for any path $Q = q_1 q_2 q_3 ... q_t$

Given we know the start state q_1 (i.e. $P(q_1)=1$)

$$\begin{split} P(q_1 \; q_2 \; ... \; q_t) &= P(q_1 \; q_2 \; ... \; q_{t-1}) \; P(q_t | q_1 \; q_2 \; ... \; q_{t-1}) \\ &= P(q_1 \; q_2 \; ... \; q_{t-1}) \; P(q_t | q_{t-1}) \qquad \textit{WHY?} \\ &= P(q_2 | q_1) P(q_3 | q_2) ... P(q_t | q_{t-1}) \end{split}$$

Step 2: Use this knowledge to get $P(q_t = s)$

$$P(q_t = s) = \sum_{Q \in Paths \text{ of length } t \text{ that end in s}} P(Q)$$

Computation is exponential in t

Convright © Andrew W. Moore

Hidden State

"It's currently time t, and human remains uncrushed. What's the probability of crushing occurring at time t + 1?"

If robot is blind:

We'll do this first

If robot is omnipotent:

(I.E. If robot knows state at time t), won't do this can compute directly.

If robot has some sensors, but

incomplete state information ...

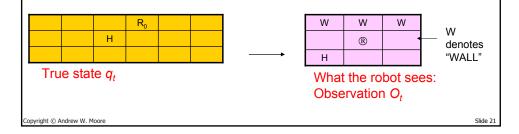

Hidden Markov Models are applicable!

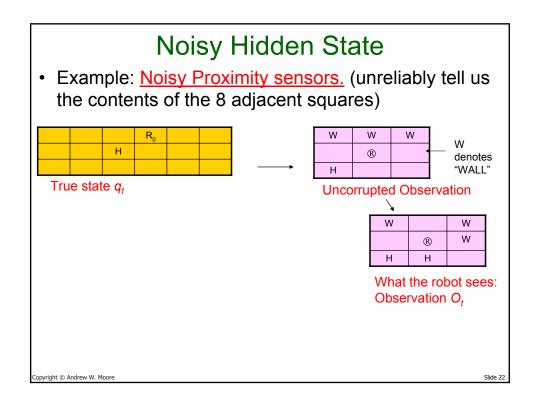

Main Body of Lecture

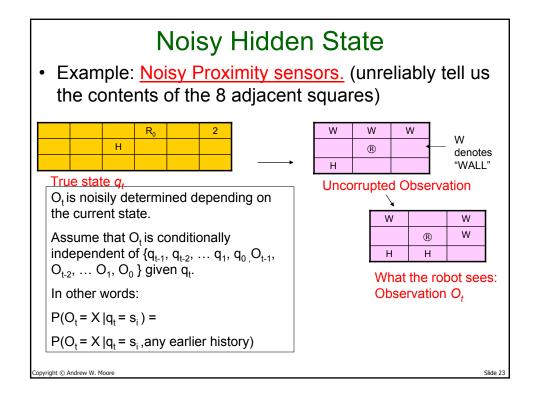

Copyright © Andrew W. Moore

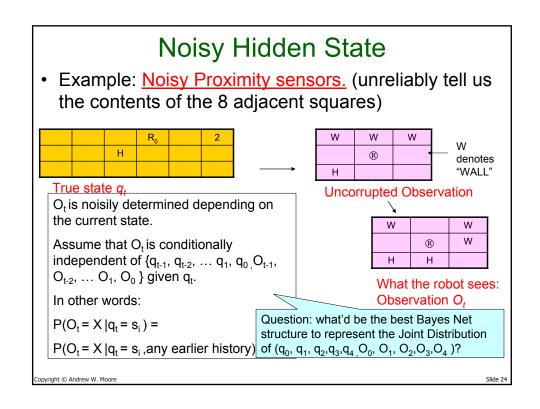

Hidden State

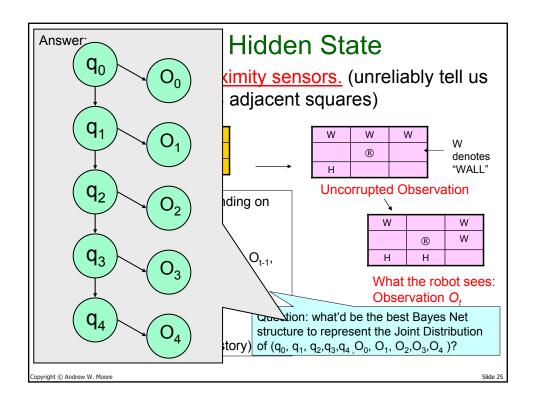

- The previous example tried to estimate $P(q_t = s_i)$ unconditionally (using no observed evidence).
- Suppose we can observe something that's affected by the true state.
- Example: <u>Proximity sensors.</u> (tell us the contents of the 8 adjacent squares)

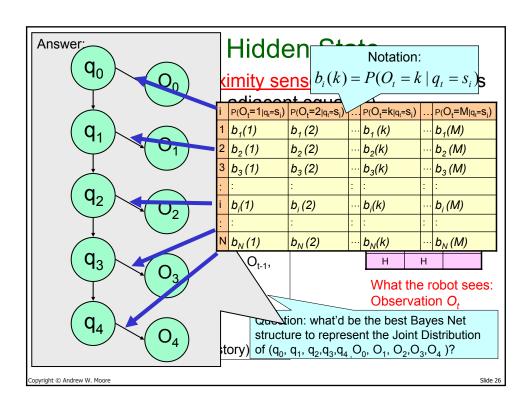

Hidden Markov Models

Our robot with noisy sensors is a good example of an HMM

Question 1: State Estimation

What is $P(q_T=S_i \mid O_1O_2...O_T)$

It will turn out that a new cute D.P. trick will get this for us.

· Question 2: Most Probable Path

Given $O_1O_2...O_T$, what is the most probable path that I took? And what is that probability?

Yet another famous D.P. trick, the VITERBI algorithm, gets this.

Question 3: Learning HMMs:

Given $O_1O_2...O_T$, what is the maximum likelihood HMM that could have produced this string of observations?

Very very useful. Uses the E.M. Algorithm

Copyright © Andrew W. Moore

Slide 27

Are H.M.M.s Useful?

You bet !!

- Robot planning + sensing when there's uncertainty (e.g. Reid Simmons / Sebastian Thrun / Sven Koenig)
- Speech Recognition/Understanding
 Phones → Words, Signal → phones
- Human Genome Project
 Complicated stuff your lecturer knows nothing about.
- Consumer decision modeling
- Economics & Finance.

Plus at least 5 other things I haven't thought of.

Basic Operations in HMMs

For an observation sequence $O = O_1$, O_T , the three basic HMM operations are:

Problem	Algorithm	Complexity
Evaluation:	Forward-Backward	O(TN ²)
Calculating $P(q_t=S_i \mid O_1O_2O_t)$		
Inference:	Viterbi Decoding	O(TN ²)
Computing $Q^* = argmax_Q P(Q O)$		
Learning:	Baum-Welch (EM)	O(TN ²)
Computing $\lambda^* = \arg\max_{\lambda} P(O \lambda)$		-()

T = # timesteps, N = # states ___

HMM Notation (from Rabiner's Survey) Hidden Markov Models and Selected Applications in Speech

The states are labeled S_1 S_2 .. S_N Recognition," Proc. of the IEEE, Vol.77, No.2, pp.257-286, 1989.

For a particular trial....

Let T be the number of observations

> is also the number of states passed through

 $O = O_1 O_2 ... O_T$ is the sequence of observations

 $Q = q_1 q_2 ... q_T$ is the notation for a path of states

 $\lambda = \langle N, M, \{\pi_{i,}\}, \{a_{ij}\}, \{b_i(j)\} \rangle$ is the specification of an **HMM**

pyright © Andrew W. Moor

HMM Formal Definition

An HMM, λ, is a 5-tuple consisting of

- N the number of states
- M the number of possible observations
- $\{\pi_1, \, \pi_2, \, ... \, \pi_N\}$ The starting state probabilities

 $P(q_0 = S_i) = \pi_i$

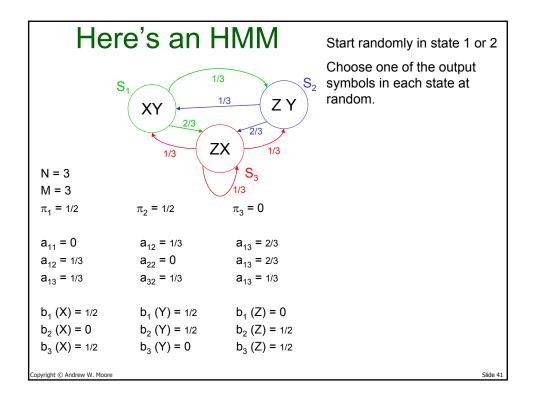

This is new. In our previous example, start state was deterministic

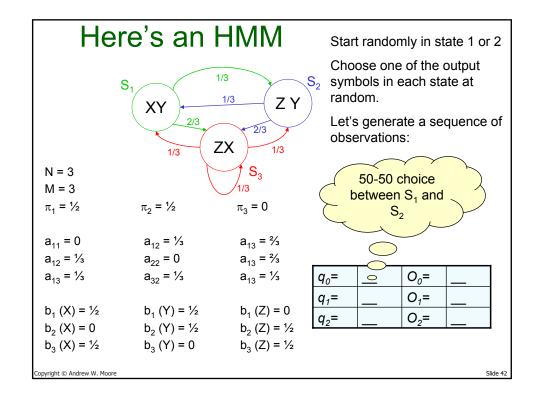

- The state transition probabilities $P(q_{t+1}=S_i | q_t=S_i)=a_{ii}$

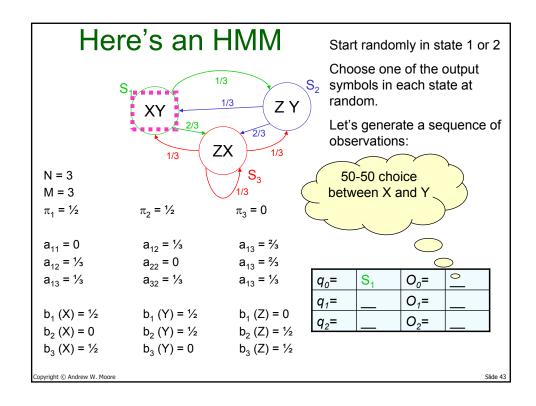

b₁(2) ... $b_1(1)$ $b_1(M)$ $b_2(M)$ $b_2(1)$ $b_N(2)$... $b_N(M)$ $b_{N}(1)$

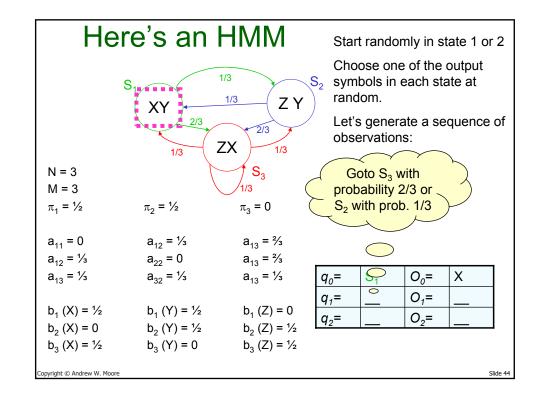

The observation probabilities $P(O_t=k \mid q_t=S_i)=b_i(k)$

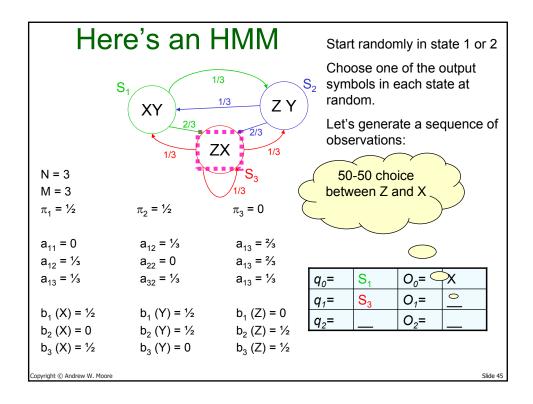

opyright © Andrew W. Moor

 $b_1(Y) = \frac{1}{2}$

 $b_2(Y) = \frac{1}{2}$ $b_3(Y) = 0$

Χ

Easy Question

We can cheaply compute

$$\alpha_t(i)=P(O_1O_2...O_t \land q_t=S_i)$$

(How) can we cheaply compute

$$P(O_1O_2...O_t)$$
 ?

(How) can we cheaply compute

$$P(q_t=S_i|O_1O_2...O_t)$$

Copyright © Andrew W. Moore

Easy Question

We can cheaply compute

$$\alpha_t(i)=P(O_1O_2...O_t \land q_t=S_i)$$

(How) can we cheaply compute

$$P(O_1O_2...O_t)$$
 ? $\sum_{i=1}^{N} \alpha_i(i)$

$$P(q_t = S_i | O_1 O_2 ... O_t)$$

(How) can we cheaply compute
$$P(\mathbf{q_t} = \mathbf{S_i} | \mathbf{O_1} \mathbf{O_2} ... \mathbf{O_t}) \qquad \frac{\alpha_{t}(i)}{\sum\limits_{j=1}^{N} \alpha_{t}(j)}$$

pyright © Andrew W. Moor

Most probable path given observations

What's most probable path given $O_1O_2...O_T$, i.e.

What is
$$\underset{Q}{\operatorname{argmax}} P(Q|O_1O_2...O_T)$$
?

Slow, stupid answer:

$$\underset{Q}{\operatorname{argmax}} P(Q|O_1O_2...O_T)$$

$$= \underset{Q}{\operatorname{argmax}} \frac{P(O_1 O_2 ... O_T | Q) P(Q)}{P(O_1 O_2 ... O_T)}$$

$$= \underset{Q}{\operatorname{argmax}} P(O_1 O_2 ... O_T | Q) P(Q)$$

Efficient MPP computation

We're going to compute the following variables:

$$\delta_t(i) = \max_{\substack{q_1 q_2 ... q_{t-1} \\ q_1 q_2 ... q_{t-1}}} P(q_1 \ q_2 \, ... \ q_{t-1} \wedge q_t = S_i \wedge O_1 \, ... \, O_t)$$

= The Probability of the path of Length t-1 with the maximum chance of doing all these things:

...OCCURING

and

...ENDING UP IN STATE Si

and

...PRODUCING OUTPUT O₁...O_t

DEFINE: $mpp_t(i) = that path$

So: $\delta_t(i) = \text{Prob}(\text{mpp}_t(i))$

Copyright © Andrew W. Moore

Slide 61

The Viterbi Algorithm

$$\delta_t(i) = q_1 q_2 \dots q_{t-1} P(q_1 q_2 \dots q_{t-1} \land q_t = S_i \land O_1 O_2 \dots O_t)$$

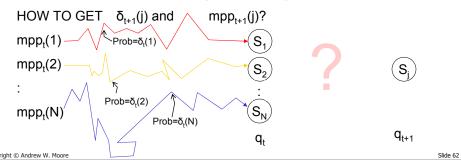

argmax

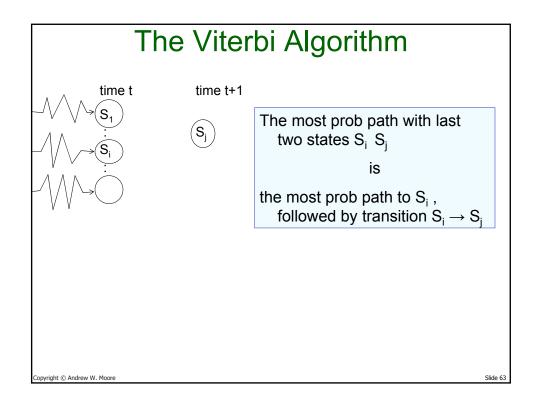

$$mpp_{t}(i) = q_{1}q_{2}...q_{t-1} P(q_{1}q_{2}...q_{t-1} \wedge q_{t} = S_{i} \wedge O_{1}O_{2}..O_{t})$$

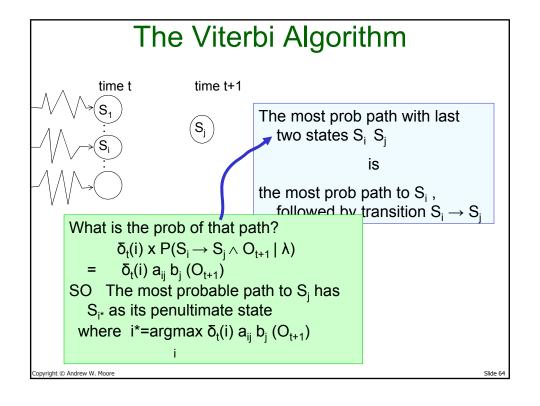

$$\delta_1(i) = \text{ one choice } P(q_1 = S_i \wedge O_1)$$
$$= P(q_1 = S_i)P(O_1|q_1 = S_i)$$

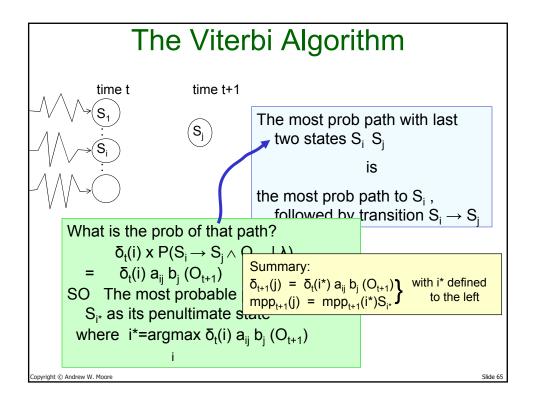

$$=\pi_i b_i(O_1)$$

Now, suppose we have all the $\delta_t(i)$'s and $mpp_t(i)$'s for all i.

What's Viterbi used for?

Classic Example

Speech recognition:

Signal \rightarrow words

HMM → observable is signal

→ Hidden state is part of word formation

What is the most probable word given this signal?

UTTERLY GROSS SIMPLIFICATION

In practice: many levels of inference; not one big jump.

Copyright © Andrew W. Moore

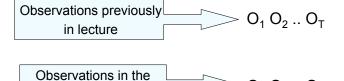

HMMs are used and useful

But how do you design an HMM?

Occasionally, (e.g. in our robot example) it is reasonable to deduce the HMM from first principles.

But usually, especially in Speech or Genetics, it is better to infer it from large amounts of data. $O_1 O_2 ... O_T$ with a big "T".

>>> 0₁ 0₂ .. 0

next bit

Slide 67

Inferring an HMM

Remember, we've been doing things like

$$\mathsf{P}(\mathsf{O}_1\,\mathsf{O}_2 \ldots \mathsf{O}_T \mid \lambda \,)$$

That " λ " is the notation for our HMM parameters.

Now We have some observations and we want to estimate λ from them.

AS USUAL: We could use

- (i) MAX LIKELIHOOD $\lambda = \underset{\lambda}{\operatorname{argmax}} P(O_1 ... O_T | \lambda)$
- (ii) BAYES

Work out P($\lambda \mid O_1 ... O_T$)

and then take E[λ] or max P(λ | O₁ .. O_T)

Copyright © Andrew W. Moore

Max likelihood HMM estimation

Define

$$\begin{split} & \gamma_{t}(i) = P(q_{t} = S_{i} \mid O_{1}O_{2}...O_{T} , \lambda) \\ & \epsilon_{t}(i,j) = P(q_{t} = S_{i} \land q_{t+1} = S_{j} \mid O_{1}O_{2}...O_{T} , \lambda) \end{split}$$

 $y_t(i)$ and $\varepsilon_t(i,j)$ can be computed efficiently $\forall i,j,t$ (Details in Rabiner paper)

$$\sum_{t=1}^{T-1} \gamma_t(i) = \sum_{t=1}^{T-1} \gamma_t(i)$$
 Expected number of transitions out of state i during the path

$$\sum_{t=1}^{T-1} \gamma_t(i) = \sum_{t=1}^{T-1} \varepsilon_t(i) = \sum_{t=1}^{T-1} \varepsilon_t(i,j) = \sum_{t=1}^{T-1} \varepsilon_t(i,j)$$

$$\begin{split} & \gamma_t(i) = \mathrm{P}\big(q_t = S_i \big| O_1 O_2 ... O_T, \lambda \big) \\ & \varepsilon_t\big(i,j\big) = \mathrm{P}\big(q_t = S_i \wedge q_{t+1} = S_j \big| O_1 O_2 ... O_T, \lambda \big) \\ & \sum_{t=1}^{T-1} \gamma_t(i) = \mathrm{expected\ number\ of\ transitions\ out\ of\ state\ i\ during\ path} \\ & \sum_{t=1}^{T-1} \varepsilon_t\big(i,j\big) = \mathrm{expected\ number\ of\ transitions\ out\ of\ i\ and\ into\ j\ during\ path} \end{split}$$

HMM estimation

Notice
$$\frac{\sum_{t=1}^{T-1} \varepsilon_t(i, j)}{\sum_{t=1}^{T-1} \gamma_t(i)} = \frac{\left(\begin{array}{c} \text{expected frequency} \\ i \to j \end{array}\right)}{\left(\begin{array}{c} \text{expected frequency} \\ \text{i} \end{array}\right)}$$

= Estimate of Prob(Next state S_i |This state S_i)

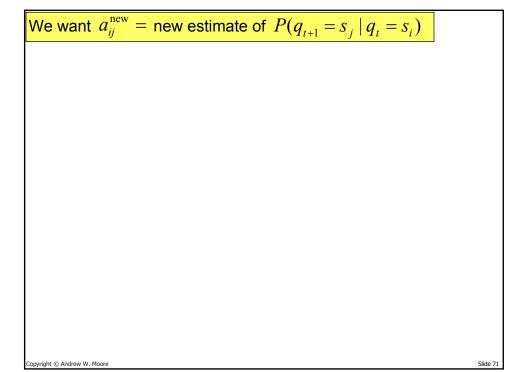

We can re - estimate

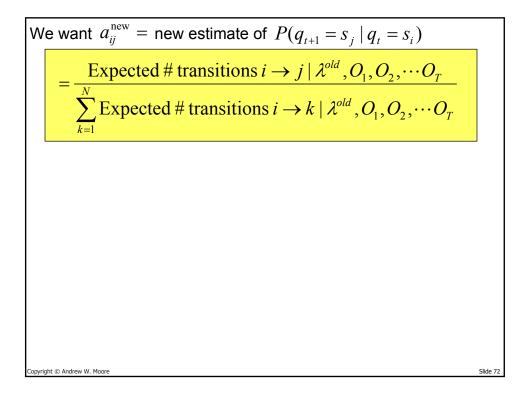

$$\mathbf{a}_{ij} \leftarrow \frac{\sum \varepsilon_t(i,j)}{\sum \gamma_t(i)}$$

We can also re - estimate

$$b_i(O_k) \leftarrow \cdots$$

 $b_j(O_k) \leftarrow \cdots$ (See Rabiner)

We want
$$a_{ij}^{\text{new}} = \text{new estimate of } P(q_{t+1} = s_j \mid q_t = s_i)$$

$$= \frac{\text{Expected \# transitions } i \to j \mid \lambda^{old}, O_1, O_2, \cdots O_T}{\sum_{k=1}^{N} \text{Expected \# transitions } i \to k \mid \lambda^{old}, O_1, O_2, \cdots O_T}$$

$$= \frac{\sum_{t=1}^{T} P(q_{t+1} = s_j, q_t = s_i \mid \lambda^{\text{old}}, O_1, O_2, \dots O_T)}{\sum_{k=1}^{N} \sum_{t=1}^{T} P(q_{t+1} = s_k, q_t = s_i \mid \lambda^{\text{old}}, O_1, O_2, \dots O_T)}$$

Slide 73

We want
$$a_{ij}^{\text{new}} = \text{new estimate of } P(q_{t+1} = s_j \mid q_t = s_i)$$

$$= \frac{\text{Expected \# transitions } i \to j \mid \lambda^{old}, O_1, O_2, \cdots O_T}{\sum_{k=1}^{N} \text{Expected \# transitions } i \to k \mid \lambda^{old}, O_1, O_2, \cdots O_T}$$

$$= \frac{\sum_{t=1}^{T} P(q_{t+1} = s_j, q_t = s_i \mid \lambda^{\text{old}}, O_1, O_2, \cdots O_T)}{\sum_{k=1}^{N} \sum_{t=1}^{T} P(q_{t+1} = s_k, q_t = s_i \mid \lambda^{\text{old}}, O_1, O_2, \cdots O_T)}$$

$$= \frac{S_{ij}}{\sum_{k=1}^{N} S_{ik}} \text{ where } S_{ij} = \sum_{t=1}^{T} P(q_{t+1} = s_j, q_t = s_i, O_1, \dots O_T \mid \lambda^{\text{old}})$$

$$= \text{What?}$$

pyright © Andrew W. Moore

We want
$$a_{ij}^{\text{new}} = \text{new estimate of } P(q_{t+1} = s_j \mid q_t = s_i)$$

$$= \frac{\text{Expected \# transitions } i \to j \mid \lambda^{old}, O_1, O_2, \cdots O_T}{\sum_{k=1}^{N} \text{Expected \# transitions } i \to k \mid \lambda^{old}, O_1, O_2, \cdots O_T}$$

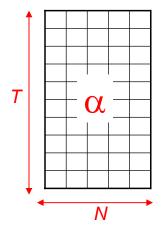

$$= \frac{\sum_{k=1}^{T} P(q_{t+1} = s_j, q_t = s_i \mid \lambda^{\text{old}}, O_1, O_2, \cdots O_T)}{\sum_{k=1}^{N} \sum_{t=1}^{T} P(q_{t+1} = s_k, q_t = s_i \mid \lambda^{\text{old}}, O_1, O_2, \cdots O_T)}$$

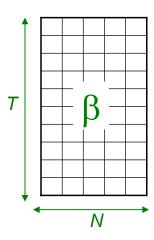

$$=\frac{S_{ij}}{\sum\limits_{k=1}^{N}S_{ik}} \text{ where } S_{ij} = \sum\limits_{t=1}^{T}P(q_{t+1}=s_j,q_t=s_i,O_1,\cdots O_T\mid \lambda^{\text{old}})$$

$$= a_{ij}\sum\limits_{t=1}^{T}\alpha_t(i)\beta_{t+1}(j)b_j(O_{t+1})$$

We want
$$a_{ij}^{\text{new}} = S_{ij} \bigg/ \sum_{k=1}^N S_{ik}$$
 where $S_{ij} = a_{ij} \sum_{t=1}^T \alpha_t(i) \beta_{t+1}(j) b_j(O_{t+1})$

We want
$$a_{ij}^{\text{new}} = S_{ij} \bigg/ \sum_{k=1}^N S_{ik}$$
 where $S_{ij} = a_{ij} \sum_{t=1}^T \alpha_t(i) \beta_{t+1}(j) b_j(O_{t+1})$

EM for HMMs

If we knew λ we could estimate EXPECTATIONS of quantities such as

Expected number of times in state i

Expected number of transitions $i \rightarrow j$

If we knew the quantities such as

Expected number of times in state i

Expected number of transitions $i \rightarrow j$

We could compute the MAX LIKELIHOOD estimate of

$$\lambda = \langle \{a_{ij}\}, \{b_i(j)\}, \pi_i \rangle$$

Roll on the EM Algorithm...

Copyright © Andrew W. Moore

EM 4 HMMs

- Get your observations O₁ ...O_T
- 2. Guess your first λ estimate $\lambda(0)$, k=0
- 3. k = k+1
- 4. Given $O_1 ... O_T$, $\lambda(k)$ compute $\gamma_t(i) , \ \epsilon_t(i,j) \quad \forall \ 1 \le t \le T, \quad \forall \ 1 \le i \le N, \quad \forall \ 1 \le j \le N$
- 5. Compute expected freq. of state i, and expected freq. i→j
- 6. Compute new estimates of a_{ij} , $b_j(k)$, π_i accordingly. Call them $\lambda(k+1)$
- 7. Goto 3, unless converged.
- Also known (for the HMM case) as the BAUM-WELCH algorithm.

Slide 79

Bad News

There are lots of local minima

Good News

 The local minima are usually adequate models of the data.

Notice

- EM does not estimate the number of states. That must be given.
- Often, HMMs are forced to have some links with zero probability. This is done by setting a_{ij}=0 in initial estimate λ(0)
- Easy extension of everything seen today: HMMs with real valued outputs

Copyright © Andrew W. Moore

Dad Name

Trade-off between too few states (inadequately modeling the structure in the data) and too many (fitting the noise).

There are lots q

Thus #states is a regularization parameter.

Blah blah blah... bias variance tradeoff...blah blah...cross-validation...blah blah...AlC, BIC....blah blah (same ol' same ol')

The local minim data.

√otice

- EM does not estimate the number of states. That must be given.
- Often, HMMs are forced to have some links with zero probability. This is done by setting a_{ij}=0 in initial estimate λ(0)
- Easy extension of everything seen today: HMMs with real valued outputs

Slide 81

DON'T PANIC: starts on p. 257.

What You Should Know

- What is an HMM?
- Computing (and defining) α_t(i)
- The Viterbi algorithm

Outline of the EM algorithm

 To be very happy with the kind of maths and analysis needed for HMMs

Fairly thorough reading of Rabiner* up to page 266*
 [Up to but not including "IV. Types of HMMs"].
